Allaheimer's disease amyloid beta protein precursor - rat
N,Alternate names: beta-A4 amyloid protein
C,Species: Rattues norvegicus (Norway rat)
C,Species: Rattues norvegicus (Norway rat)
C,Accession: 800550; A41245; A39820; S46251
R,SBiverst, B.D.; Hilbid, C.; Multhaup, G.; Salbaum, M.; Beyreuther, K.; Seeburg, P.H.
EMBO J. 7, 1365-1370, 1988
A,Title: Alzheimer's disease amyloidogenic glycoprotein: expression pattern in rat brain
A,Reference number: 800550; MUID:88312583; PMID:2900758
A,Accession: 800550

A; Fille: Genomic sequence of a Lyme disease spirochaete, Borrelia burgdorferi.
A; Accession: G70116
A; Status: preliminary; nucleic acid sequence not shown; translation not shown
A; Residues: 1-457 «KLE»
A; Cross-references: UNIPROT:O51160; UNIPARC:UPI0000057372; GB:AE000783; NIC
A; Superfamily: histidyl-tRNA synthetase; histidine-tRNA ligase homology
C; Keywords: aminoacyl-tRNA synthetase; ligase; protein blosynthesis
F; 8-418/Domain: histidine-tRNA ligase homology «HTL»
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 34
T45816
hypothetical protein F2809.230 - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 04-Feb-2000 #sequence_revision 04-Feb-2000 #text_change 09-Jul-2004
C;Accession: T45816
R;Benes, V; Rechmann, S; Borkova, D; Ansorge, W; Mewes, H.W.; Lemcke, K.; Mayer, K.F
Submitted to the Protein Sequence Database, January 2000
A;Reference number: Z23014
A;Reference number: Z23014
A;Accession: T45816
A;Atatus: preliminary
A;Molecule type: DNA
A;Residues: 1-470 cABEN>
A;Cross-references: UNIPROT:Q9M2K9; UNIPARC:UPI000009D548; EMBL:AL137080
A;Experimental source: cultivar Columbia; BAC clone F2809
C;Genetics:
A;Map position: 3
A;Introns: 33/1; 59/1
A;Note: F2809.230
C;Superfamily: Arabidopsis thaliana hypothetical protein F2809.230
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             자

A;Title: Analysis of 1.9 Mb of contiguous sequence from chromosome 4 of Arabidopsis thal A;Reference number: A71400; MUID:98121113; PMID:9461215
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         phosphoprotein phosphatase (EC 3.1.3.16) rdgC - fruit fly (Drosophila melanogaster)
NyAlternate names: retinal degeneration protein C
C;Species: Drosophila melanogaster
C;Species: Drosophila melanogaster
C;Accession: A42287; 827811

peptide in dog, polar bear and five other mammals by cross-species
polymerase chain reaction analysis.",
Brain Res. Mol. Brain Res. 10:299-305(1991).
-- FUNCTION: Functional neuronal receptor which couples to
intracellular signaling pathway through the GTP-binding protein
G(O) (By similarity).
-- SUBCELLULAR LOCATION: Type I membrane protein.
-- SIMILARITY: Belongs to the APP family.
                                                                                                                                                                       PubMed=15201367; DOI=10.1136/jnnp.2003.010611;

Alzheimer's disease amyloid A4 protein homolog [Contains: Soluble APP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Deta (S-APP-beta); CTF-alpha; Beta-amyloid protein 42 (Beta-APP42);
Beta-amyloid protein 40 (Beta-APP40); Gamma-CTF(59) (Gamma-secretase
C-terminal fragment 59); Gamma-CTF(57) (Gamma-secretase C-terminal
                                                                                                                                                                                                             CTF-alpha (By similarity).
Beta-amyloid protein 42 (By similarity)
Beta-amyloid protein 40 (By similarity)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Johnstone E.M., Chaney M.O., Norris F.H., Pascual R., Little S.P.;
"Conservation of the sequence of the Alzheimer's disease amyloid
peptide in dog, polar bear and five other mammals by cross-species
polymerase chain reaction analysis.";
Brain Res. Mol. Brain Res. 10:299-305(1991).
-!- FUNCTION: Functional neuronal receptor which couples to
intracellular signaling pathway through the GTP-binding protein
G(O) (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TISSUE=Heart;

Villard L., Tassone F., Crnogorac-Jurcevic T., Clancy K., Gardiner K.;
"Analysis of pufferfish homologues of the AT-rich human APP gene.";
Gene 210:17-24 (1998).
-!- FUNCTION: Functional neuronal receptor which couples to
intracellular signaling pathway through the GTP-binding protein
G(O) (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the APP family.
-!- SIMILARITY: Contains I BPTI/Kunitz inhibitor domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PROSITE; PS00319; A4 EXTRA; 1.

```
The invention relates to methods of therapy for Alzheimer's disease using peptides (AAW45143-6) that bind to the neurotrophin receptor p75 nerve growth factor receptor (NGFR) and competitively inhibit the binding of a beta-amyloid to the p75 NGFR. Also described is a new method for cevaluating the risk of an individual to develop Alzheimer's disease using cultured neural crest-derived melanocytes. The methods can be used for diagnosing and treating Alzheimer's disease and other neurodegenerative diseases mediated by beta-amyloid protein, or by aberrant activation of the low affinity NGFR localised on neural cell surfaces, such as autoimmune encephalomyelitis, Huntington's disease, cortico-basal degeneration, progressive supra-nuclear palsy, Gerotman-Shausslesr Scheinker syndrome, Neimann-Pick disease, and progressive supranuclear palsy, obtainable from skin biopsies, are good model cells for the study and diagnosis of Alzheimer's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a cyclic peptide which competes with and competitively inhibites beta-amyloid binding to the p75 neurotrophin receptor (p75NTR). P75NTR is a low affinity nerve growth factor (NGF) receptor which is expressed by melanocytes and keratinocytes of the basal epidermis. Apoptosis can be inhibited by appropriate ligands e.g. protein. If the receptor is occupied by appropriate ligands e.g. neurotrophins, apoptosis is inhibited. Other examples of appropriate ligands include this cyclic peptide. This peptide is based on the sequence of the binding fragment of beta-amyloid, which binds to p75NTR in Alzheimer's disease. This cyclic peptide can be used in methods to control or manipulate keratinocyte or melanocyte cell death. The methods involve using this peptide or peptides ANY39234-Y39235 to bind as a pseudo-ligand can induce or maintain hair growth, hair colour or skin.
                                                                                                                                                                                                                                              /note= "N-terminus is attached via a peptide bond to the C-terminus amino acid at position 10"
                                                                                                                                                                                                                                                                                          /note= "C-terminus is attached via a peptide bond to the N-terminus amino acid at position 1"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Controlling or manipulating melanocyte and keratinocyte cell death, useful for treating, e.g. alopecia areata.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 colour. Inducing or maintaining hair growth is useful for treating alopecia areata or male pattern baldness in vertebrates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

The invention relates to a method of inhibiting beta-amyloid binding to the p75 nerve growth factor receptor (NGFR) of a cell. The method involves contacting the cell with a substance having the amino acid sequence lysine-glycine-lysine or lysine-glycine-lysine or lysine-glycine-manne. The substance binds to the p75 NGFR resulting in the inhibition of beta-amyloid protein or beta-amyloid peptide binding to the p75 NGFR. The invention is useful for evaluating the risk of an individual to develop Alzheimer's disease and methods of therapy for Alzheimer's disease using peptides that bind to the neurotrophin receptor (NTR) and competitively inhibit the binding of beta-amyloid to the receptor. In vitro methods are also provided for screening substances and identifying those capable of inhibiting, or decreasing oell apoptosis mediated by beta-amyloid. The present sequence beta-amyloid peptide
                                                                                                                                     Beta-amyloid, p75; nerve growth factor receptor; NGFR; anti-apoptotic; Alzheimer's disease; neurotrophin receptor; NTR; human; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Evaluating risk of an individual to develop Alzheimer's disease using cultured neural crest-derived melanocytes and methods of therapy for Alzheimer's disease using peptides that bind to the neurotrophin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100.0%; Score 57; DB 5; Length 10; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to the p75 nerve growth factor receptor. The methods comprise contacting receptor. The methods are useful in the diagnosis and treatment of Alzheimer's disease and other neurodegenerative diseases mediated by beta amyloid protein, or by aberrant activation of the low affinity nerve growth factor receptor localised on neural cell surfaces. Such diseases include autoimmune encephalowyelitis, Huntington's disease, pick's disease, corticobasal degeneration, progressive supranuclear palsy, derceman. Shaussiers Scheinker syndrome, Niemann-Pick disease and Down's syndrome. The present sequence is a cyclic peptide comprising a fragment of the human beta-amyloid protein to which a cysteine residue has been added at each end. The peptide inhibits binding of beta-amyloid to the

    .10
/note= "the peptide has a cyclic structure as a result of
the bonding between the two cysteine residues"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to methods for inhibiting binding of beta-amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ŏ

                                                                                                                                                                                                                                                                                                                 The invention relates to a novel peptide that inhibits beta-amyloid binding to neural crest-derived cells or beta-amyloid mediated apoptosis of neural crest-derived cells, comprising amino acid sequence lysine-glycine-lanine. The peptide is a cyclic peptide. A peptide of the invention has nootropic and neuroprotective activity. The methods and compositions of the present invention are useful for evaluating risk to, diagnosing and treating Alzheimer's disease using neural crest-derived melanocytes and peptides that bind the neurotrophin receptor (p75NTR) and inhibit binding of beta-amyloid to the present sequence represents a cyclic peptide of the
                                                                                                                                                                                                                                                      New peptide inhibiting beta-amyloid binding to neural-crest-derived cells or beta-amyloid mediated apoptosis of neural-crest-derived cells, useful for diagnosing and treating Alzheimer's disease.

A cyclic peptide was synthesised by attaching two cysteine residues to the beginning and the end of the fragment. The invention relates to a new method for evaluating the risk of an individual to develop Alzheimer's disease using cultured neural crest-derived melanocytes. Also described are methods of therapy for Alzheimer's disease using peptides (AAM45343-6) that bind to the neurotrophin receptor p75 nerve growth factor receptor (NGFR) and competitively inhibit the binding of a beta-amyloid Alzheimer's disease and other neurodegenerative diseases mediated by beta-amyloid protein, or by aberrant activation of the low affinity NGFR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the
                                                                                                                                                                                                                                                                                                                                                               Evaluating risk of individual to develop Alzheimer's - uses cultured epidermal melanocyte(s), also useful for developing therapies for neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          localised on neural cell surfaces, such as autoimmune encephalomyelitis, Huntington's disease, cortico-basal degeneration, progressive supranuclear palsy, Gerotman-Shaussleer Scheinker syndrome, Neimann-Pick disease, and progressive supranuclear palsy. In the diagnostic tests, the human melanocytes, which are easily obtainable from skin biopsies, are good model cells for the study and diagnosis of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     p75NTR; p75 neurotrophin receptor; nerve growth factor; NGF; melanocyte; p6ratinocyte; apoptosis; Bc1-2; beta-amyloid fragment; Alzheimer's disease; pseudo-ligand; hair growth; hair colour; skin colour; alopecia areata; male pattern baldness.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Beta-amyloid fragment for generation of p75NTR inhibiting peptides.

                                                                                                                                                                                                                                                                                 d
                                                                                                This sequence is amino acids 24-31 of beta-amyloid. This sequence can be used to generate cyclic peptide AAY39233. The cyclic peptide competes with and competitively inhibits beta-amyloid binding to the p75 control of the Edward in PASNTR is a low affinity nerve growth factor (NOF) receptor Which is expressed by melanocytes and keratinocytes of the basal epidermis. Apoptosis can be inhibited by p75NTR via the cupregulation of the BC1-2 protein. If the receptor is occupied by appropriate ligands e.g. neurotrophins, apoptosis is inhibited. Other examples of appropriate ligands include this cyclic peptide. This peptide CC is based on the sequence of the binding fragment of beta-amyloid, which chinds to p75NTR in Alzheimer's disease. This cyclic peptide can be used in methods to control or manipulate keratinocyte or melanocyte cell cath. The methods involve using this peptide or peptides AAY39234-Y39235 to bind as a pseudo-ligand to the p75 neurotrophin receptor, inhibiting apoptosis. The new method can induce or maintain hair growth, hair colour cor skin colour. Inducing or maintaining hair growth is useful for treating alopecia areata or male pattern baldness in vertebrates
                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibition of beta-amyloid binding to the p75 nerve growth factor receptor using polypeptides, useful in the diagnosis and treatment of e.g. Alzheimer's disease.

Cr. The invention relates to come those for chimbiting blinding of beta-amyloid to the PSP nerve growth factor receptor. The methode comprise contacting corts call with a substance that binds to the PSP arrey growth factor receptor. The methode are useful in the diagnosis and treatment of the call with a substance that binds to the PSP arrey growth factor receptor. The methode are useful in the diagnosis and treatment of the case fitting area of the factor fac

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel peptide that inhibits beta-amyloid binding to neural crest-derived cells or beta-amyloid mediated apoptosis of neural crest-derived cells, comprising amino acid sequence lysine-glycine-alamine. The peptide is a cyclic peptide. A peptide of the invention has nootropic and neuroprotective activity. The methods and compositions of the present invention are useful for evaluating risk to, diagnosing and treating Alzheimer's disease using neural crest-derived melanocytes and peptides that bind the neurotrophin receptor (pySNTR) and inhibit binding of beta-amyloid to the p7SNTR. The present sequence represents a peptide fragment of beta-amyloid, used to produce a cyclic decapeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide inhibiting beta-amyloid binding to neural-crest-derived cells or beta-amyloid mediated apoptosis of neural-crest-derived cells, useful for diagnosing and treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         beta-amyloid, melanocyte, nootropic, neuroprotective, Alzheimers disease, degeneration; neurological disease.
to the neurotrophin receptor and competitively inhibit the binding of beta-amyloid to the receptor. In vitro methods are also provided for screening substances and identifying those capable of inhibiting, or decreasing cell apoptosis mediated by beta-amyloid. The present sequence represents a beta-amyloid peptide fragment

The present invention describes an isolated amyloid beta peptide or its homologue which is selected by a method comprising: (a) determining the binding value of each amino acid of a subsequence of amyloid beta peptide upon binding to a HLA class I and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids of the subsequence, cc comparing the resulting score to a preselected value. Also described: (c) comparing the resulting score to a preselected value. Also described: (c) a vaccine comprising the isolated amyloid beta peptide and a carrier or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual conversing a beta amyloid or homologue peptide to an individual, (c) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual; (c) a kit for matching a vaccine comprising amyloid beta composition convective activity, and can be used in convective anyloid beta peptide is useful for preparing a composition convecting the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present sequence convention or progression of amyloid beta peptide is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New amyloid beta peptide, useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated amyloid beta peptide or its homologue which is selected by a method comprising: (a) determining the binding value of each amino acid of a subsequence of amyloid beta peptide upon binding to a HLA class 1 and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids obtained in step (1); and (c) comparing the resulting score to a preselected value. Also described: (1) a vaccine comprising the isolated amyloid beta peptide and a carrier or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual to a vaccine; (4) matching a vaccine comprising a beta amyloid or homologue peptide to an individual, (5) a kit for matching a vaccine comprising anyloid beta peptide to an individual based on the HLA haplotype of the individual; and (6) preventing the formation or progression of amyloid plaques. The amyloid beta peptide has neuroprotective activity, and can be used in vaccines. The amyloid beta peptide is useful for preparing a composition of preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New amyloid beta peptide, useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention describes an isolated amyloid beta peptide or its homologue which is selected by a method comprising: (a) determining the homologue which is selected by a method comprising: (a) determining the binding value of cales II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids obtained in step (1); and (c) comparing the resulting score to a preselected value. Also described: (1) a vaccine comprising the isolated amyloid beta peptide and a carrier or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual to a vaccine; (4) matching a vaccine comprising a beta amyloid or homologue peptide to an individual, (5) a kit for matching a vaccine comprising a watching a vaccine comprising an individual based on the HLA haplotype of the individual based o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             °,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and (b) preventing the formation or progression of anyloid plaques. The amyloid beta peptide has neuroprotective activity, and can be used in vaccines. The amyloid beta peptide is useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present sequence represents an amyloid beta (Abeta) peptide, which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated amyloid beta peptide or its homologue which is selected by a method comprising: (a) determining the binding value of each amino acid of a subsequence of amyloid beta peptide upon binding to a HLA class I and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids of the subsequence, cc ocmparing the resulting score to a preselected value. Also described: cc or diluent; (2) determining The isolated amyloid beta peptide and a carrier or diluent; (2) determining T-cell epitopes within amyloid beta peptide; cor diluent; (3) precident amyloid or homologue peptide and a carrier or diluent; (5) a kit for matching a vaccine comprising a beta amyloid or homologue peptide to an individual; (c) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual; cand (6) preventing the formation or progression of amyloid plaques. The amyloid beta apptide has neuroprotective activity, and can be used in vaccines. The amyloid beta peptide is useful for preparing a composition of preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

disease associated with amyloid deposits of amyloid precursor protein dAPP) Abeta fragments in the brain of a patient, which comprises antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-ternial segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Amyloid deposit; APP; Abeta, brain, human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective;
                                                                                                                                                                                                                                                                                                       Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method of preventing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 39; DB 4; Length 10;

                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                         being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease
                                                                                                  This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Pc receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises

administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (FC receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nociropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel recombinant hepadnavirus nucleocapsid protein, termed as chimeric hepatitis B core protein, displays immunogenic epitopes at N-terminus, HBc immunogenic loop with linker for conjugated epitope and C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunogenic; hepadnavirus nucleocapsid protein; hepatitis B core; HBc; vaccine; B cell epitope; T cell epitope; immunostimulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

ö
compositions that are particles of similar sequence that lack any Cterminal Cys residues. The chimer molecule exhibits the self-assembly not exhibiting the nucleic acid binding of those native particles, and excellent B cell and T cell immunogenicities. The chimer particles are typically prepared in higher yield than similar particles that are free of a C-terminal Cys. The particles are often far more immunogenic than the similar conjugates that lack a C-terminal Cys. Immunogenicities of particles assembled from the chimer molecules are enhanced as compared to similar particles assembled from chimer molecules are enhanced as compared to similar particles assembled from chimer molecules lacking at least one C-terminal Cys. AAU93802-AAU93997 represent immunogenic HBC particles amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of treating chronic hepatitis comprising administering to a patient a T cell-stimulating amount of a vaccine comprising immunogenic particles dissolved or dispersed in a diluent, where the immunogenic particles consists of recombinant hepatitis B core (HBC) chimeric protein molecules, and maintaining the patient to induce T cells activated against HBC. The methods and compositions of the present invention are useful for treating chromic hepatitis B infection. This is the amino acid sequence of a chimeric hepatitis B virus related B-cell epitope useful for expression within the HBV chimer at the N-terminus, within the immunoigenic loop and/or at the C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating chronic hepatitis B infection by administering a T cell-stimulating vaccine containing immunogenic particles having recombinant carboxy-terminal truncated hepatitis B core (HBC) chimeric protein

This invention relates to novel recombinant immunogenic chimeric avian hepatitis B core (AHBC) nucleocapsid proteins. Specifically, it refers to an AHBC protein that has been engineered to display an immunogenic B cell cor T cell epitope, exhibit enhanced stability and an absence of nucleic acid binding as a self assembled particle. The present invention acid binding as the containing introduced cysteine residues that confers an enhanced containing introduced cysteine residues that confers an enhanced stability in aqueous solution, an increased yield and more immunogenicity than similar conjugates that lack N- or C-terminal cysteines. Everthemore, a reduction in the number of positively charged residues (lysine and arginine) towards the C-terminus prepares self-assembled particles that are substantially free of nucleic acid binding. As such, these chimeric particles can be used as immunogens of an inoculum that induce a B cell or T cell response in an animal to produce antibodies. It can also be useful for developing a vaccine to protect against the pathogen from which the heterologous epitope or the hapten is derived. Accordingly, these compositions exhibit immunostimulant, antibacterial and virucidal activities. This peptide sequence is an exemplary B-cell epitope peptide immunogen useful for both linkage to the linker residue after expression of a contemplated chimer and for expression within an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a recombinant chimer hepatitis B core (HBC)
protein molecule that includes a peptide-bonded heterologous immunogenic
epitope at the N-terminus in the HBC immunodeniant loop or the C-
terminus of the chimer, or a heterologous linker residue for a conjugated
epitope present in the loop. The invention also relates to an immunogenic
particle comprising the recombinant hepatitis B core chimeric protein
molecules, a vaccine comprising the immunogenic particles dissolved or
dispersed in a diluent, a nucleic acid that encodes a recombinant HBC
protein molecule or its variant, analogue, or complement and a method for
inducing an immune response in an inoculated and maintaining the inoculated
animal for a period of time sufficient to enable development of an immune
constant of the recombinant chimer hepatitis B core protein molecule is
used in an immunogenic particle for preparing a vaccine useful for
inducing an immune response in an inoculated host animal. This sequence
represents an HBC protein immunogenic B cell epitope of the invention.

The invention relates to a novel recombinant chimeric Hepatitis B virus nucleocaspid (core) protein (HBC), up to 600 or 380 amino acid residues in changer. The chimeric protein is engineered for both enhanced stability of self-assembled particles and the substantial absence of nucleic acid binding by the particles. The invention further comprises: a recombinant the protein chimeric molecule that has a length of 135-365 amino acid residues and contains four peptide-linked amino acid residue sequence domains from the N-terminus that are denominated Domains I, II, III and IV. The invention also provides nucleic acids, polypeptides, host cells, rectors and transgenic animals used in the methods of the invention are chimeric compositions of the invention sof the present invention are useful in the fields of immunology and protein engineering, in particular for using a chimeric hepatitis B virus nucleocapsid protein as an immunogen in a vaccine for Hepatitis B infections. This sequence immunogen are the present and a sequence immunogen in a vaccine for Hepatitis B infections. This sequence impresents a Hepatitis B virus nucleocapsid (core) protein related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to treating chronic hepatitis, by administering a vaccine comprising immunogenic particles having recombinant hepatitis B core (HBC) chineric protein molecules (where truncated Hbc molecules are linked N-terminally or C-terminally to an immunogenic epitope). that stimulate T cell production, to a patient chronically infected with hepatitis B virus, and maintaining patient for time sufficient to induce T cells activated against HBC. The chimeric proteins are still capable self-assembling into particles upon expression in a host cell and are substantially free of binding to nucleic acids, and the particles display enhanced stability. Also included is enhancing (M2) the production of one or more of gamma-producing CD8+, CD4+ T cells and cytotoxic T lymphocytes against hepatitis B virus, involving administering to a patient of a vaccine comprising immunogenic particles dissolved or dispersed in a diluent containing one or both of an agonist of toll-like receptor 4 and TLR-9), the immunogenic particles comprising HBC receptor 9 (TLR-4 and TLR-9), the immunogenic particles comprising HBC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric protein molecules and maintaining the patient for a sufficient time to induce T cells activated against HBc. The immunogenic epitopes may be B cell or T cell epitopes. The chimeric vaccine is useful for treating a patient chronically infected with hepatitis B virus. The present sequence is a B cell epitope suitable for inclusion in the chimeric protein of the invention.
Human; chronic hepatitis; HBC; nucleocapsid core protein; vaccine; immunogenic apitope; T cell; B cell; CD8+ cell; CD4+ cell; Cytotoxic T lymphocyte; toll-like receptor 4; toll-like receptor 9; TLR-4; TLR-9; epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating chronic hepatitis, by administering vaccine comprising immunogenic particles having recombinant hepatitis B core chimmeric protein molecules, that stimulates T cell, to patient chronically

Example 4; SEQ ID NO 118; 306pp; English.

```
The invention relates to at least one isolated mammalian amyloid antibody comprising at least one variable region comprising at least one variable region comprising at least one light chain, of a fully defined sequence of SEQ ID (CC MOS: 48, 49, 59, 60, 69, 70, 79 and 80, respectively. Also described are: (i) at least one isolated marmalian amyloid antibody that binds to the compression of an amyloid polypeptide as an antibody comprising at least one heavy chain or light chain complementarity determining region (CDR) having the amino acid sequence of at least one of SEQ ID NO: 73-78, (ii) having the amino acids SEQ ID NO: 50, 73+60, (iii) at least one plicope celetced from amino acids (SEQ ID NO: 50, (iii) an isolated nucleic acid encoding at least one of any of the isolated mammalian amyloid artibody sequence of SEQ ID NO: 51, 52, 61, 62, 71, 72, 81 and 82, (iv) an artibodies mentioned and having at least one buman CDR of a fully defined artibodies mentioned and having at least one of any of the isolated mucleic acid encoding an isolated nucleic acid encoding an amyloid antibody, (v) a prokaryotic or entaryotic host cell comprising an isolated nucleic acid encoding an amyloid antibody, (vi) a method of producing at least one amyloid antibody, (vi) a method of composition comprising at least one of any of the isolated mammalian amyloid antibody or the anyloid antibody or tragment that specifically binds at least one anyloid antibody or tragment that specifically binds at least one fange contexting or entaring an amyloid antibody or tragment that specifically binds at least one for the amyloid antibody with a contexting or contexting or contexting or anyloid antibody, and a least composition or anyloid antibody or mantioned, where the device is suitable for contexting or anyloid antibody, and a least one amyloid antibody or to, the cell, tissue, organ or anyloid antibodies menti

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CENZ )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (BENS/)
```

AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention

Sequence 14 AA;

88333

```
The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a

cactive group (II) (e.g. succhimidy) and malebando groups) attached to

a less therapeutically active amino acid region (IV), which covalently

bonds with amino/hydroxyl/thiol groups on blood components to form a

comprision of therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides of protect them from peptidase activity in

cactors and neurotransmitters, to protect them from peptidase activity in

cactors and neurotransmitters, to protect them from peptidase activity in

cactors and neurotransmitters, to group and actaching therapeutic peptidases in the body.

Completing and attaching therapeutic peptidase to albumin prevents or

reduces the action of peptidases to increase longth of activity (half

life) and specificity as bonding to large molecules decreases

intracellular uptake and interference with physiological processes.
                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
providing a host cell or transgenic animal or transgenic plant or plant
                cell capable of expressing the antibody in recoverable amounts. The methods and compositions of the present invention are useful for producing therapeutic compositions and devices for treating amyloid-associated disorders, such as Alzheimer's disease, cancer, allergies, autoimmune disease, Parkinson's disease, AIDS, multiple solerosis, migraine, dementia and infections. This sequence represents a peptide from human beta-amyloid probed with anti-beta-amyloid IgG antibodies.
                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.
                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Thibaudeau K;
                                                                                                                                                                                                              Length 12;
                                                                                                                                                                                                                                                    Indels

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptide e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases in the action of peptidases to large molecules decreases in the action of peptidases to large molecules decreases in the action of peptidases to large molecules decreases in the action of peptidases to processes length of activity (half life) and specificity as bonding to large molecules decreases in the macellular upcase and interference with physiological processes. AMBOSQS to AMBOSQ41 represent peptides which can be used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a

reactive group (II) (e.g. succinimidyl and maleimido groups) attached to
a less therapeutically active amino acid region (IV), which covalently
bonds with amino/hydroxyl/thiol groups on blood components to form a

peptidase stabilised therapeutic peptide components to form a

condition of the readment of peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth

confort the treatment of various disorders. Endogenous therapeutic

peptides are not suitable as drug candidates as they require frequent

conforting and attaching therapeutic peptides to albumin prevents or

reduces the action of peptidases to increase length of activity (half

infe) and specificity as bonding to large molecules decreases.

ABB90829 to ABB9241 represent peptides which can be used in the

exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention relates to a novel expression cassette and methods for high yield production of polypeptides. The cassette comprises an operably linked nucleic acid sequence, where the expression of the cassette produces a tandem polypeptide that forms an inclusion body when expressed in a cell. The expression cassette is useful for producing peptide and polypeptide in a cell, preferably a tandem polypeptide that forms an inclusion body when expressed in a cell. The present sequence is that of a polypeptide which may be produced using the expression cassette of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New expression cassette comprising an operably linked nucleic acid sequence, useful for producing a tandem polypeptide that forms an inclusion body when expressed in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The invention discloses a method for preventing the formation or growth of amyloid fibrils or plaques without causing neurotoxicity. The method comprises administering an inactivation effective amount of an amyloid peptide-inactivating enzyme to a mammal. The strategy is to hydrolyse the amyloid beta (Abeta) peptides before they form amyloid plaques using the zinc metallopeptidase insulin dezarding enzyme (IDE), insulysin or neprelysin. The methods and enzymes are useful for treating (e.g peptide therapy) Alzhaimer's disease. The enzymes are useful for inducing the synthesis of endogenous amyloid inactivating enzymes, such as insulysin or neprelysin, within the brain of the affected individuals. The sequence presented is a Abetal-40 peptide insulysin cleavage product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of preventing formation or growth of amyloid plaque without causing neurotoxicity which comprises generating a recombinant viral or plasmid vector comprising a DNA sequence encoding at least one amyloid peptide inactivating enzyme operably linked to a promoter. The methods are useful for treating Alzheimer's disease by increasing the activity of an amyloid inactivating enzyme. The present sequence represents the amino acid sequence of a human A beta 1-40
  Preventing formation or growth of amyloid fibrils or plaques without causing neurotoxicity, useful for treating Alzheimer's disease, comprises administering an amyloid peptide inactivating enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preventing formation or growth of amyloid plaques without causing neurotoxicity, useful for treating Alzheimer's disease, by generating vector comprising a DNA sequence encoding at least one amyloid peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises an expression cassette which produces a tandem bolypeptide that form an inclusion body when expressed in a cell. The expression cassette of the invention is useful for producing a peptide or polypeptide in a cell, preferably a tandem polypeptide that forms an inclusion body when expressed in a cell. The present amino acid sequence represents a peptide which may be used in the construction of a tandem polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rat; amyloid beta; Abeta; amyloid fibril; amyloid plaque; neurotoxicity; amyloid peptide-inactivating enzyme; hydrolysis; zinc metallopeptidase; insulin degrading enzyme; IDS; insulysin; neprelysin; peptide therapy; Alzheimer's disease; nootropic; neuroprotective.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention discloses a method for preventing the formation or growth of amyloid fibrils or plaques without causing neurotoxicity. The method comprises administering an inactivation effective amount of an amyloid peptide-inactivating enzyme to a mammal. The strategy is to hydrolyse the amyloid beta (Abeta) peptides before they form amyloid plaques using the zinc metallopeptidase insulin degrading enzyme (IDE), insulysin or neprelysin. The methods and enzymes are useful for treating (e.g peptide therapy) Alzheimer's disease. The enzymes are useful for inducing the synthesis of endogenous amyloid inactivating enzymes, such as insulysin or neprelysin, within the brain of the affected individuals. The sequence presented is a Abetal-40 peptide insulysin cleavage product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preventing formation or growth of amyloid fibrils or plaques without causing neurotoxicity, useful for treating Alzheimer's disease, comprises administering an amyloid peptide inactivating enzyme.
                                                                                                                                                                                                                                                                                                                    Rat; amyloid beta; Abeta; amyloid fibril; amyloid plaque; neurotoxicity; amyloid peptide-inactivating enzyme; hydrolysis; zinc metallopeptidase; insulin degrading enzyme; IDE; insulysin; neprelysin; peptide therapy; Alzheimer's disease; nootropic; neuroprotective.

                                      The invention relates to a method of preventing formation or growth of amploid plaque without causing neurotoxicity which comprises generating a recombinant viral or plasmid vector comprising a DNA sequence encoding at least one amyloid peptide inactivating enzyme operably linked to a promoter. The methods are useful for treating Albaimer's disease by increasing the activity of an amyloid inactivating enzyme. The present sequence represents the amino acid sequence of a human A beta 1-40
                                                                                                                                                                                                                                                                                                                            Gaps

Preventing formation or growth of amyloid fibrils or plaques without causing neurotoxicity, useful for treating Alzheimer's disease, comprises administering an amyloid peptide inactivating enzyme.
                                                                                                                                                                                                                                                                        is a vaccine or a component of a vaccine and where the ADDLs are antigenic, immunogenic or act as a binding molecule when the composition is administered to a host organism. The composition, vaccine or antibodies are useful in inducing an immune response. The composition, peptides, molecules and antibodies are useful in preventing or ameliorating Alzheimer's disease, memory and learning deficits, degeneration or malfunction of neurones and in preventing or treating Down's syndrome. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rat amyloid beta 1-40 (Abetal-40) peptide insulysin cleavage product #10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rat; amyloid beta; Abeta; amyloid fibril; amyloid plague; neurotoxicity;
                                                       immune response and in preventing, ameliorating or treating Alzheimer's disease, memory and learning deficits, degeneration or malfunction of neurons or Down's syndrome.
                                                                                                                                                                                                            The present invention relates to a new pharmaceutical composition comprising amyloid beta-derived diffusable ligands (ADDLs) capable of generating an immune response in a host organism, where the composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             amyloid peptide-inactivating enzyme; hydrolysis; zinc metallopeptidase; insulin degrading enzyme; IDE; insulysin; neprelysin; peptide therapy; Alzheimer's disease; nootropic; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention discloses a method for preventing the formation or growth of amyloid fibrils or plaques without causing neurotoxicity. The method comprises administering an inactivation effective amount of an amyloid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new pharmaceutical composition comprising amyloid beta-derived diffusable ligands (ADDLs) capable of generating an immune response in a host organism, where the composition is a vaccine or a composition of a vaccine and where the ADDLs are antigenic, immunogenic or act as a binding molecule when the composition is administered to a host organism. The composition, vaccine or antibodies are useful in inducing an immune response. The composition, peptides, molecules and antibodies are useful in inducing an immune response. The composition, ameliorating Altheimer's disease, memory and learning deficite, degeneration or malfunction of neurones and in preventing or treating Down's syndrome. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                             New amyloid beta-derived diffusable ligands, useful in generating an immune response and in preventing, ameliorating or treating Alzheimer's disease, memory and learning deficits, degeneration or malfunction of

peptide-inactivating enzyme to a mammal. The strategy is to hydrolyse the amyloid beta (Abeta) peptides before they form amyloid plaques using the zinc metallopeptidase insulin degrading enzyme (IDB), insulysin or neprelysin. The methods and enzymes are useful for treating (e.g peptide therapy) Alzheimer's disease. The enzymes are useful for inducing the synthesis of endogenous amyloid inactivating enzymes, such as insulysin or neprelysin, within the brain of the affected individuals. The sequence presented is a Abetal-40 peptide insulysin cleavage product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        at a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of preventing formation or growth of amyloid plaque without causing neurotoxicity which comprises generating recombinant viral or plasmid vector comprising a DNA sequence encoding a least one amyloid peptide inactivating enzyme operably linked to a promoter. The methods are useful for treating Alzheimer's disease by increasing the activity of an amyloid inactivating enzyme. The present sequence represents the amino acid sequence of a human A beta 1-40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ಡ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventing formation or growth of amyloid plaques without causing neurotoxicity, useful for treating Alzheimer's disease, by generating vector comprising a DNA sequence encoding at least one amyloid peptide
                                                                                                                                                                           Gaps

```
The present invention describes a modified therapeutic peptide (I)

Comprising a therapeutically active amino acid region (III) and a

cactive group (II) (e.g. succinimidyl and maleimido groups) attached to

a less therapeutically active amino acid region (IV), which covalently

composed with amino/hydroxyl/thiol groups on blood components to form a

peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth

factors and neurotransmitters, to protect them from peptidase activity in

convictor the treatment of various disorders. Endogenous therapeutic

convictor the treatment of various disorders as they require frequent

administration due to rapid degradation by peptidases in the body.

Conditying and attaching therapeutic peptidas to albumin prevents or

reduces the action of peptidases to increase length of activity (half

(Iffe) and specificity as bonding to large molecules decreases

Ciffel and specificity as bonding to large molecules decreases

cintracellular uptake and interference with physiological processes.

Comprising a therapeutically active amino acid region (III) and a

reactive group (II) (e.g. succinimidyl and maleimido groups) attached to

a less therapeutically active amino acid region (IV), which covalently

bonds with amino/hydroxyl/thiol groups on blood components to form a

peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth

factors and neurotransmitters, to protect them from peptidase activity in

catcors and neurotransmitters, to protect them from peptidase activity in

The present invention relates to a method for detecting betabeta-sheet conformation (C1) of insoluble proceins or prions in a sample. The method involves reacting the sample with at least one alpha-helix or random coil conformational probe (P1) that interacts with (C1) to undergo a conformational probe (P2) that interacts with (C1) to undergo a conformational conversion to a predominantly betabeta-sheet conformation of ggregates. The levels of aggregates with (C1); and detecting levels of aggregates. The levels of aggregates correlate to levels of (C1). (P1) is preferably a palindromic peptide probe which produce betabeta sheets when complexed with the target protein. The method is useful for diagnosing a disease associated with conformationally altered proteins or prions (such as low-density lipoprotein receptor, cystic fibrosis transmembrane complactor, Huntingfin, Abeta peptide, prion, insulin-related amyloid, hemoglobin, a synuclein, rhodopsin, crystailline and p53) e.g. Alzheimer's disease, prion disease, Creutzfeld Jakob disease, scrapie and bovine spongiform encephalopathy (PPP(SC)), amyotrophic lateral sclerosis (SOD or neurofilament), Pick's disease, Parkinson's disease, Prontotemporal dementia, type II diabetes, multiple myeloma-plasma cell dyscrasias, familial amyloidotic polyneuropathy, medullary carninoma of thyroid, familial amyloidotic polyneuropathy, medullary carninoma of thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
Detection of conformationally altered proteins or prions in sample useful for diagnosing e.g. Alzheimer's disease involves reacting the sample with palindromic probe having amino acid sequence of specific protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                senile cardiac and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chronic renal failure, congestive heart failure, senile cardiac and systemic amyloidosis (transthyretin), chronic inflammation, atherosclerosis, familial amyloidosis or Huntington's disease. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
